Please note: If you are using ARALOC Cloud Hosting to store your content, this FAQ does not apply to your organization.

Content Servers

Where can I host my Secure Package-based ARALOC content?

ARALOC Content packages can be hosted on any website, content portal, or file sharing location. The locations of the packages themselves are unrelated to security features.

In order to take advantage of ARALOC features such as the Library, Catalog and syncing functionality, the encrypted package must be hosted on a web site that is publically accessible by the internet so that ARALOC apps can download them on request.

Can I store my content on a server that is behind my organization's firewall?

Yes. However, this means that devices and PCs must also be behind the organization's firewall to download or synchronize content. This can be accomplished via a VPN or requiring users to be on-premises.

Content activation and viewing can still occur outside the companies firewall after the content has been transferred to the device.

Can I store my content on a server that requires the user to log in?

Yes. Users can log into a portal or web site and download ARALOC files individually, and open them in an ARALOC PC or mobile app.

However, standard ARALOC applications cannot directly access files from a web site that is behind a login page. Library and syncing functionality will not be available.

Custom integration options are available. Please contact your Modevity representative for details.

WebDav Servers

What is a WebDav Server?

WebDav is a file transfer protocol that is based on the HTTP web protocol. It allows individuals to upload documents, including ARALOC Packages, directly to a web site.

How does ARALOC support WebDav servers?

The ARALOC Publisher can automatically upload protected content to a WebDav server. This allows content to be made available for viewing in a single publication step.

Am I required to setup a WebDav server to use ARALOC?

No. If a WebDav server is not used, then the ARALOC Publisher will create the ARALOC Package file and save it on a local directory on the machine. Afterwards, this file can be manually moved to its final hosted location. The ARALOC Publishing API can also enable customized publishing scenarios. Please contact your Modevity representative for details.

How do I install a WebDav server?

The installation and basic configuration of a WebDav server depends on the specific version of the server operating system (Windows, Linux, OSX Server).

Information on installing a WebDav server on a Windows Server can be found here:

<http://learn.iis.net/page.aspx/350/installing-and-configuring-webdav-on-iis-7/>

How do I configure security on the WebDav server?

A basic WebDav server configuration will have two accounts configured.

- 1) Anonymous users will have read-only access to files.
- 2) A Publishing user with read/write/delete access to files.

This publishing user should be configured with an obscure name and password and should not have additional access to the server. The server information, including the publishing account name and password, are then entered into the ARALOC Management console. At that point, the system is ready to publish files to the new server.

Custom publishing and hosting options are available. Please contact your Modevity representative for details.
